How did you approach the project?

I approached the project by following the suggestions given. I wrote it first in psuedo code then tried it in java but failed so I resorted to working in python instead.

How did you organize the project? Why?

The project was organized based upon the functions used. This is due to functionality above all else.

What problems did you encounter?

The biggest problem I encountered was when the 5 seconds are over (the bank is closed), the Tellers do not accept anymore customers.

If you did not complete some feature of the project, why not?

Again, the one feature that is not fully developed is that of the Tellers not accepting a customer in line after the bank closes. I attribute this

to workers wanting to go home after a long day of work, rather than staying overtime for a customer who does not care enough to show up 10 minutes before close.
